

Abstract

The present invention is a cosmetic material characterized by comprising silicone-modified wax wherein low-molecular-weight polyethylene and/or low-molecular-weight polypropylene is linked to silicone via ester linkage.

The present cosmetic material spreads easily and gives a refreshing feel to users. In addition, it has strong repellency to sweat and water, but does not impair moderate transpiration of moisture when it is coated. And the coating thereof imparts elasticity, smoothness, emollient effect and so on. Further, it is excellent in natural luster-imparting effect and storage stability.
